

HW 01 – Literature Analytics

INF 110 Discovering Informatics
School of Informatics, Computing, and Cyber Systems
Northern Arizona University

In this project, you will use the Jupyter Notebook from the first day of class to analyze a book you like. I recommend selecting a book from [Project Gutenberg](#), but there are some rules:

- Don't select the example from class (Pride and Prejudice).
- Don't select any of the texts used in the book.
- Try to come up with some other ways to analyze the book (not just character analysis).

This homework is intended to give you the opportunity to setup and test the Anaconda environment. **START EARLY!** If you can't setup Anaconda the night before the assignment is due, you might lose most of the points.

Objectives (20 pts)

The following demonstration objectives will be scored on a scale 0-5:

- Correctly loads a book
- Correctly uses Markdown cells and provides appropriate comments
- Correctly uses code (Python) cells
- Does an interesting analysis of the book

Upload your notebook to BBLearn to be scored.
